State of the Art Phishing Protection

Inky Phish Fence provides better protection and more feedback to your users. It catches even the latest wave of deep sea phishing attacks that use clever tricks to hide from both trained users and conventional email filters. Protect yourself from the number one source of wire fraud, identity theft, and malware/ransomware delivery: get Inky today!

- All incoming mail is automatically checked against over two dozen computer vision and text analysis models that “see” the message much like a person would — so even very convincing forgeries get blocked.
- Malicious mail can be automatically quarantined, while questionable mail can be delivered with a clear, prominent warning that your users will understand.
- Protects against both spear phishing and brand forgery attacks.
- Deploys organisation-wide in 1-2 hours.
- Works with any mail client, on any device.
- “Report Phish” link in the mail sends the mail to your SOC.
- Analytics dashboard gives IT/Security total visibility, supporting time-bounded queries.
- Includes state-of-the-art spam and anti-malware protection.
- HTML sanitisation blocks XSS, JavaScript, CSS attacks
- Real-time analysis engine does not slow down mail delivery.

The Inky Dashboard

The Inky dashboard gives admins comprehensive statistics on recent attacks and prevention rates. For example:

- Which employees were most targeted with spear phishing over the last month?
- How many phishing attacks did we block this week?
- What are the top 50 domains responsible for brand forgery attempts targeting our users?

Inky is proud to comply with the requirements of the Cyber Essentials Scheme Sector: Professional, scientific and technical

Deep Sea Phishing Example : DocuSign

How it works - a real world example dissected

The latest phishing attempt making its rounds on the internet was stopped dead in its tracks by Inky. Discover how Inky thwarted a dangerous DocuSign phishing attempt.

Brand Impersonation

Unicode Alphabet

Domain Spoofing

A Very Convincing Forgery

The email looks exactly like a real DocuSign message. It's even digitally signed using DKIM so other security products think it's legitimate. But notice the sender's domain? It's missing a letter i. The attacker has cleverly set up a new domain that's visually nearly identical to DocuSign's real domain.

Inky Detects Domain Forgery, Unlike any Other Product

Inky knows about all the top internet sites in the world, and can tell when a domain is confusingly similar to one of these.

Inky Can Even Spot Forgery Attempts that Humans Cannot

The internet is international, supporting every writing system in the world. But this has created opportunities for attackers: they can now replace a letter in a victim's domain with another identical-looking letter from another writing system and register this alternative new domain. The result? The new domain looks identical to the human eye. But not to Inky, because Inky knows which letters are easily confused, across all writing systems.
